## Anthropometric Information of School Children

Pilot survey covering selected 213 children in fifth, sixth, seventh & eighth standards in two MPUPS and two ZPHS located in U. Kothapalli & Thondangi Mandals of Kakinada District, AP

## NUTSHELL SUMMARY

This baseline study aims mainly to provide anthropometric information on selected school children against which to monitor and assess the progress of intervention and effectiveness during and after a certain period. It covered 213 school children studying in fifth, sixth, seventh, and eighth standards in selected Mandal Parishad Upper Primary Schools and Zilla Parishad High Schools in U.Kothapalli and Tondangi Mandals of Kakinada district, Andhra Pradesh.

It summarizes the BMI results of 213 sample children, highlighting that most are "severely underweight" (66%), and few are "underweight" (16%). It indicates these children could be malnourished with low protein-energy deficiency. Such a scenario may impact their normal health and cognitive skills and cap their learning outcomes. According to their BMI results, quite a few are in normal weight (18%).

The proposed intervention focusing on "nutritious breakfast" to all 6323 children in 40 schools by HKMCF, from the ultra-modern kitchen in Special Economic Zone (SEZ) at Perumallapuram Village, Thondangi Mandal in Kakinada established with Aurobindo Pharma Foundation (APF) support, hypothetically aims at improving nutrition among the school children to improve their school attendance, learning, and cognitive outcomes.

# CONTEXT

Food insecurity and poor nutrition remain a problem in many developing countries, including India. These twin variables can profoundly affect children’s health and development. To address the challenge, the Government of India has introduced the Mid-day Meal Scheme for school-going-age children to mitigate hunger and malnutrition. Simultaneously, the scheme was aimed at increasing school enrolment and attendance.

Many Corporates have joined with the Government to strengthen its interventions addressing malnutrition among school children.

Along with the corporates, charitable organizations such as Hare Krishna Movement Charitable Foundation (HKMCF) joined hands in improving the outcomes.

In this context, Aurobindo Pharma Foundation extended its philanthropic support of INR 9.36 crores to the HKMCF in setting up a centralized kitchen at the SEZ in Perumallapuram village, Thondangi Mandal, Kakinada District in Andhra Pradesh, and to meet recurring expenditure for five years. The current initiative aims to distribute hot-cooked breakfast to the rural children in primary and secondary schools in the selected 40 government-run schools across 38 villages in Thondangi and U-Kothapalli (Uppada Kothapalli) Mandals.

On April 24, 2022 Aurobindo Pharma Foundation and Hare Krishna Movement Charitable Trust entered into an MoU to run kitchen in KSEZ in Kakinada district. Photo Credit: The Hindu

The approximate direct beneficiaries would be around 6323 children and the hypothetical results expected are:

1. Healthy & hunger-free children in schools
2. Increased school attendance and retention among all social categories
3. Improved learning skills among the children
4. Stand as one of the best CSR models across the country.

To examine the change that resulted from the proposed intervention it is essential (at the formative stage) to set baseline with anthropometric measurements of the children in the schools where HKMCF is going to distribute hot cooked breakfast. The study (setting the baseline information) has been assigned to the Poverty Learning Foundation.

The present report provides individual-focused anthropometric information base against which further monitoring and assessment exercises would proceed in the years to come (focussing on progress of children and effectiveness of intervention).

## THEORY OF CHANGE

The theory of change for the proposed intervention is:  
 "Facilitating school children with nutritious breakfast (as proposed by HKMCF) helps in healthy growth of children (specifically BMI) over a period, which results in improvement of their health conditions, and improved learning skills"

## Research & Sample Framework

The survey has been carried out between 18 and 24 September 2022 by trained and seasoned investigators along with the core team from PLF. The mixed methods research framework (qualitative and quantitative) has been used in collecting the information on critical anthropometric measurements: standing body height, body weight, mid arm skinfold thickness and mid arm circumference of children in V to VIII standards. These children are segregated into Mandal Parishad Upper Primary Schools (MPUPS) and Zilla Parishad High Schools (ZPHS).

A perimeter-focused, pre-validated and semi-structured questionnaire has been developed. Accordingly, general information and anthropometric measurements were collected from randomly selected 213 children (110 girls & 103 boys) studying in V, VI, VII and VIII standards in the government schools located at AV Nagaram, Mulapeta, Patha Chodipallipeta, and Srirampuram. A baseline has been set for two category cohort children: (a) children in MPUPS and (b) children in ZPHS. It has to be used while tracking the progress and the change during the impact assessment in near future.

The baseline information is focused on: (i) individual profile; (ii) school attendance (as per school records); (iii) cognitive profile (as per teachers' perception), and (iv) anthropometric profile (the real-time data). In this intervention, HKMCF proposed to cover 3384 children (100%) in 24 government schools in Thondangi Mandal and 2939 children (100%) in 16 Government schools in U. Kothapalli Mandal.

On a pilot basis, PLF has covered one MPUP school and one ZP high school in U. Kothapalli, Mandal; similarly, one MPUP school and one ZP high school in Thondangi Mandal. These schools are selected on the basis of geographical spread and outreach. Children were selected randomly (from fifth to eighth standard) for the survey keeping in view their assured availability in the school for the next two-three three years. The selection had an eye on tracking the same cohorts of select children in the schools during impact assessment study in future. The tools used during the survey are:

- a. Digital weighing scale (to measure weight)
- b. Stadiometer (to measure standing height)
- c. Skinfold callipers (to measure triceps skinfold right upper arm)
- d. Non-stretchable tape (to measure right arm circumference)baseline).

Quality control protocol has been followed while conducting anthropometric measurements. Each of the measurements of a child has been taken three times by different investigators and converted all three readings into averages. On a regular basis, every day after completing the survey, all tools were checked for their accuracy and functions.

Baseline survey measured Body Weight (BW), Standing Height (SH), Mid Upper Arm Circumference (MUAP) and Triceps Skinfold (TS). To ensure accuracy of measurement, each measurement has been taken thrice and average of three readings was finally considered. Using body weight and standing height measurements Body Mass Index (BMI) has been calculated to determine the growth pattern of children, more specifically their present status. It is complemented by body fat accumulations measured through MUAP and TS. After specific period of proposed intervention, change/impact has to be assessed against the baseline data (measurements in the baseline).

Body Mass Index is calculated on the basis of height and weight of the child by using the standard formula (often used by the Centre for Disease Control and Prevention & WHO). It is calculated using the standard formula: First step: height in centimetres converted into meters and then into meter square. Second step: average body weight divided by height in meter square that will give BMI of an individual. The standardized BMI ranges used in this baseline survey are:

- Severely underweight: below 16.5
- Under weight: between 16.6 and 18.5
- Normal weight: between 18.6 and 24
- Over weight: between 25 and 29.9
- Obese weight: above 30

Along with BMI, measurements of Mid Upper Arm Circumference (MUAC) and Skin Fold Thickness (SFT) has been recorded for verification purpose while doing impact assessment.

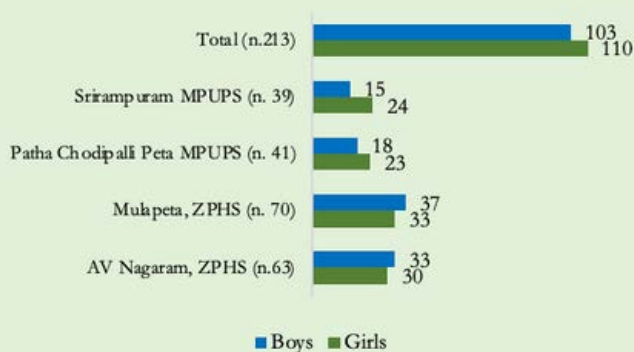

# RESULTS

The baseline survey covered 213 (110 girls & 103 boys) randomly selected school-going children from four select schools across four Mandals. Based on the total number of children in fifth to eighth standards, girls and boys were selected proportionately from each school. In total, anthropometric information has been collected from 39 children from Srirampur MPUPS, 41 from Patha Chodipallipeta MPUPS, 70 from Mulapeta ZPHS, and 63 children from AV Nagaram ZPHS (Fig 1).

As per the school records, nearly 99% of the children are regular to school, and irregularity is negligible. Survey tried to elicit performance levels (reading, writing, and simple arithmetic) and cognitive skills (attention, memory, grasping, and thinking). It was reported that 33% of the children are performing well, 44% are average, and 23% are poor in their class room performance.

Fig 1: Location-wise number of children covered

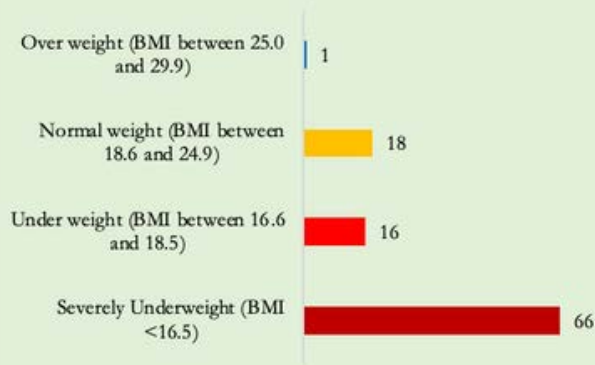

Of the total, 38% of the children in fifth to seventh standards from MPUPS, and 62% are in fifth to eighth standards in ZPHS. All these children are in the age group of 9 to 15 years. As Backward Castes are the dominant social categories in both the Mandals, 81% of the children fall under this caste group, 12% under Scheduled Castes, 14% under other Castes (OC). Only one student represents Scheduled Tribe (ST).

The significant observation is that 59% of the children across the sample are not taking Mid-Day Meals provided by the School Education department, Government of AP. Of those taking mid-day meals, roughly 50% take egg only but no other meal products. Two major reasons mentioned by those who are not taking mid-day meals are: poor quality rice and unhygienic distribution (opinion of children and their parents). Of those consuming mid-day meals, roughly 70% complained of stomach ache and frequent ill health.

The main focus of the survey is to set the baseline information on anthropometric measurements of the select children.

Fig. 2: Status of children as per BMI (in %)

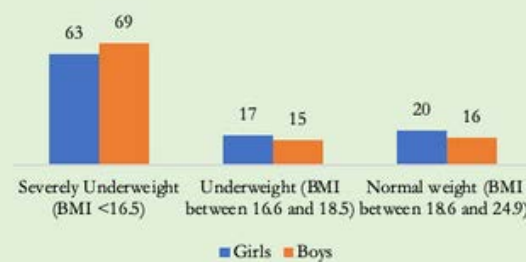

The datum and the attendant analysis highlight that of the total children, as per BMI, most of them (66%) fall under the severely underweight category. Similarly, there are a few children (16%) who come under the underweight category. Both these categories of children will have a weak immune system, slower than expected linear growth, shorter than expected height, and difficulties with learning. The survey has that a few children (18%) have average weight, and only one girl and one boy are placed under overweight category (Fig. 2).

Location-wise children's standardsification, as per their BMI, indicates that in all four locations, serverely underweight are topping the charts (Fig. 3).

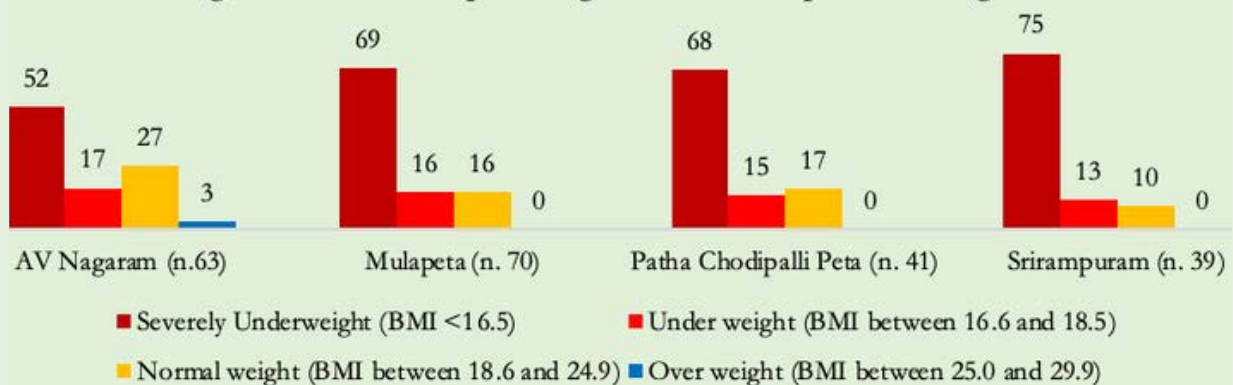

Data indicate that in severely underweight category number of boys is slightly more than girls. Whereas in underweight and normal weight categories, girls' number is slightly higher than boys (Fig. 4).

Fig. 4: Clasification of Girls and boys as per their BMI

There are only two children, one girl and one boy (aged 8 years), who reported overweight (with 25+ BMI count) in ZPHS, AV Nagaram.

Fig. 3: Location-wise percentage of children as per BMI categories

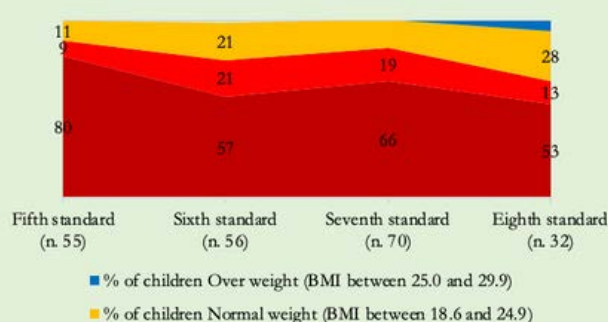

Of 56 children in the fifth standard, the BMI standardisation unfolds that majority (80%) are severely underweight, a few (9%) are underweight, and a few are normal weight (11%). Similarly, majority of children in sixth standard (57%), seventh standard (66%), and eighth standards (53%) are severely underweight. Similar trends in the underweight category are visible across all types, and there are a few children in the normal BMI category in all the standards. It may be noted in the current context that severely underweight and underweight categories must have 'protein-energy malnutrition', which will often impact their normal health (Fig 5).

It is evident that in all social groups, BMI-based severely underweight and underweight children are significant in numbers. One child from the ST community is in the underweight category (Fig. 6).

Fig. 5: Class wise childrens BMI classification (in %)

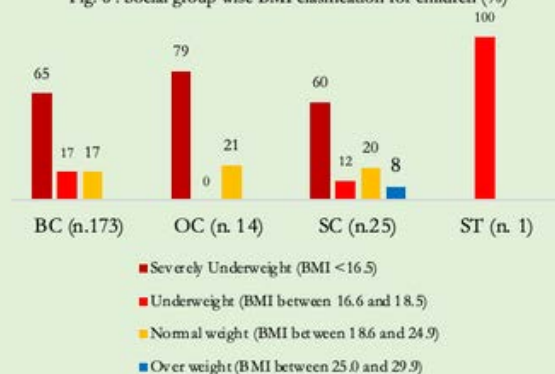

Children's age-wise BMI informs that, among girls, severely underweight and underweight children are significant in number. Out of 110 girls between 9 and 13 years, the highest majority (80%) are malnourished.

BMI Classifications	Age category of Girls (In numbers)					Total
	9	10	11	12	13	
Severely Underweight (<16.5)	7	20	17	19	5	68
Under weight (16.6 to 18.5)	2	2	3	11	1	19
Normal (18.6 to 24.9)	1	6	5	6	4	22
Over weight (25.0 to 29.9)	0	0	0	1	0	1
<b>Total number off children</b>	10	28	26	37	10	110

Similar statistics for boys shed light on the fact that of the 103 boys, the highest majority (83%) are malnourished (severely underweight and underweight categories).

Fig. 6 : Social group wise BMI classification for children (%)

A few girls are in the normal weight category, and only one girl (aged 12) is in the overweight category.

A few only are of normal weight, and only one boy (aged 12) comes under the overweight category.

BMI Classifications	Age category of Boys (In numbers)							Total
	9	10	11	12	13	14	15	
Severly Underweight (<16.5)	6	18	21	16	6	3	1	71
Under weight (16.6 to 18.5)	0	2	5	5	2	0	1	15
Normal (18.6 to 24.9)	0	1	1	5	6	3	0	16
Over weight (25.0 to 29.9)	0	0	0	1	0	0	0	1
<b>Total number of children</b>	6	21	27	27	14	6	2	103

Given the outcomes of the baseline survey, it can be concluded that the effect of malnutrition (severely underweight and underweight) on children's school performance, health and survival are strikingly visible and calls for appropriate remedy. Many research studies confirmed that malnutrition negatively impacts children's physical growth, mental development, and work efficiency.

Providing nutritious and protein-energy food items through breakfast and mid-day meals help in improving nutritional status of children. The following section highlights the synthesised baseline information for all the 213 children surveyed.

# Summary of anthropometric information of children including specific observations

( observations are  
synthesized from teams  
interaction with  
students, parents,  
teachers and with  
few villagers)

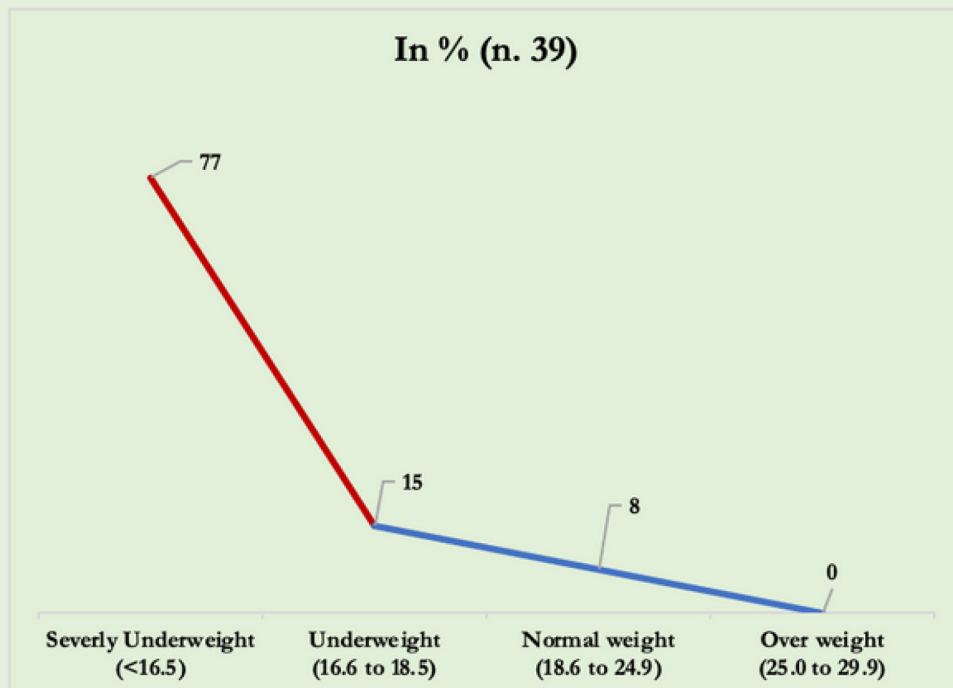

# Srirampuram, U. Kothapalli Mandal

## Survey date: 19 September 2022

There are 105 student populations in MP Upper Primary School in Srirampuram. Most (99%) are from backward-class communities (Yadava and Setti Balija), whose primary livelihoods depend on agriculture and non-agriculture activities. Though Mid-day meals are supplied regularly by the outsourced agency, their quality seems discouraging. An un-hygienic supply chain and poor quality of rice and eggs discourage students from accepting it. None of the 39 students in this survey are taking mid-day meals supplied under ICDS. Parents are particularly concerned about it after taking such food; children often complain of stomach aches. Hence, many parents have come to the school with lunch boxes at noon. A demand from the teachers attests to the conclusive verification: let the ISKON supply mid-day meal too.

The BMI classification highlights that a significant number of students are severely malnourished.

# AV Nagaram, Thondangi Mandal

## Survey date: 20 September 2022

There is a 149 student population at ZP High school in AV Nagaram. The majority are from the BC community (Yadava) whose main occupation is agriculture and non-agriculture. A private contractor supplies the mid-day meals, and most students (80%) consume them. There are no significant complaints from students or their parents about mid-day meals. Quite a few (20%) bring lunch boxes from their homes. This school is just a couple of kilometres away from the newly constructed centralized kitchen of HKMCF.

The BMI classification highlights that a significant number of students are severely malnourished. It is to be noted that significant number are in normal weight.

BASELINE INFORMATION for selected children in ZP High School, AV Nagaram, Thondangi Mandal (as on 20 September 2022)

# Patha Chodipalli Peta,, Thondangi Mandal

## Survey date: 21 September 2022

It is one of the old Upper Primary schools established in 1955. Presently it hosts 120 students, the majority from the BC community (Yadava and Balija). Girls traveling more than two kilometers to school are facilitated with bicycles by the APF and government under the bicycle scheme. Children accept mid-day meals with little complaints. A significant observation is that school surroundings are with garbage and un-hygienic, and even mid-day meals are also served un-hygienically.

The BMI classification highlights that a significant number of students are severely malnourished.

# Mulapeta, U. Kothapalli Mandal

## Survey date: 22 September 2022

Established in 1978, ZP High School is having 1012 student population. Most (90%) of the students are from BC community (Wada Balija, Devanga/Padmasali). Agriculture, non-agriculture, including fishing are the major forms of livelihoods to the parents. Most of the students (60%) are taking mid-day meals without any complaints. The rest take the meals occasionally when the contractor supply extra food item such egg fried-rice. This is the only school in the region having such facility.

The BMI classification highlights that a significant number of students are severely malnourished.

BASELINE INFORMATION for selected children in ZP high School in Malapeta, U. Kothapalli Mandal (as on 22 September 2022)																		
Child unique ID	Name of the Student	Gender	Class	Age	Social Category	Overall Rating by class teacher (cognitive skills & performance)	Standing height (average of 3 readings in cm)	Standing height in sq meters	Body weight (average of 3 readings in Kgs)	BMI	Classification of children according to BMI				Right upper arm circumference (average in mm)	Skinfold thickness (mm)	Father's/Mother's Name	Phone Number of the Parents
											Severely Under Weight (<16.5)	Under Weight (16.6 to 18.5)	Normal weight (18.6 to 24.9)	Over Weight (25.0 to 29.9)
